

PulseCode™ by Master Lock®

Innovative, cost effective access control with flexible management

AHS
ACCESS HARDWARE SUPPLY

PulseCode™ is an electronic lock that enables an access control system to operate without a conventional key or keyhole — and without direct contact between the lock and the key. PulseCode E-Lock technology uses an encrypted code of mechanical pulses, transmitted by the PulseCode Key held against a solid surface. This code can pass through solid metal, wood or glass, and opens when it “hears” the correct sequence.

The PulseCode Key is a lightweight, matchbox-sized device that transmits the code to the lock. Each PulseCode lock can be programmed to respond to up to 250 different codes; each key can open any number of locks with the same or different codes.

The innovative PulseCode system offers cost-effective access control, flexible management, simple installation and can help you better secure your facilities, resources and assets. Components include:

- Keys
- Locks
- Strikes and mounting brackets
- Data bank and PC connection cable
- Software

With billions of code combinations, no keyhole or key-to-lock contact and no visible lock, PulseCode is a truly unique, useful and flexible access control system.
